## Xilinx links with Irish research team

Tuesday, April 10 11:05:33

(BizWorld)

A major US multinational has linked up with a top Irish research team to pioneer research into advanced new telecommunications and networking systems.

Tech giant Xilinx and Ireland's Centre for Telecommunications Value Chain Research (CTVR) have begun a project in the field of adaptive radio technology.

CTVR aims to produce the technology that will allow a mobile phone to reconfigure itself automatically to each network.

The project, which Xilinx is supporting, is based at Trinity College Dublin, one of a consortium of eight research institutions forming the CTVR.

CTVR is a research organisation centred in eight Irish third-level institutions with government funding from Science Foundation Ireland and IDA Ireland. It has already attracted the involvement of Lucent Bell Labs in its initiatives.

"This is a unique opportunity for Xilinx to participate in a consortium of relevant industry and academic partners," said Dr. Robert Esser, director of Xilinx Labs in Ireland. "We have already established our own research laboratory at our Irish facility in Dublin and this programme is a great fit for us."
